Cone magnets neodymium

These neodymium magnets are cone-shaped. On the small circular area the magnetic field lines are bundled, which gives the magnets a very high adhesive force. They are perfectly suitable for whiteboards, magnetic boards, etc. The stump holds notes securely and it can be easily removed by pulling it off to the side. If the base is attached to a metal surface, however, it is hard to remove.

Waterproof neodymium magnets: rustproof & with scratch protection

The neodymium magnets in this group are entirely coated by a layer of rubber, which provides the following advantages:

Scratch protection: Delicate surfaces, such as whiteboards or magnetic glass boards, are well protected

Waterproof: These magnets are rustproof and can be used outdoors as long as the rubber coating stays intact

Friction: The rubber coat substantially increases the magnetic adhesive force in shear direction

Due to the rubber coating the maximum adhesive force of these magnets is slightly lower, however, compared to similar-sized neodymium magnets without coating.

Neodymium pot magnets with countersunk hole screw-on

Distinctive feature: These magnets can be fastened with a countersunk screw.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you won't be able to put as much strain on it.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you won't be able to put as much strain on a pot magnet if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-free and therefore intended for dry indoor use.

Neodymium channel magnets

Channel magnets are cuboid, partly square pot magnets that can be fastened with a countersunk head screw. They consist of a U-shaped steel profile into which a neodymium block magnet is embedded. This design strengthens the holding power of the magnet enormously at direct contact with a counterpart. Additionally, the steel coating protects the fragile magnet from damages caused by repeated blows.

Hook magnets neodymium: strong & practical

Distinctive feature: These magnets can be used to hang up objects. The hook can be unscrewed. You have the choice of silver, white, black and green colour.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you can strain it much less.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you can put a lot less strain on a pot magnet when you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-free and therefore intended for dry indoor use.

Eyelet magnets neodymium

Distinctive feature: These magnets are suitable for securely hanging up objects. The eyelet can be removed. You can choose between silver-coloured and white eyelet magnets. The latter are barely noticeable on white walls and ceilings. The silver eyelet magnets are slightly cheaper and stronger.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you won't be able to put as much strain on it.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you won't be able to put as much strain on a pot magnet if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-proof and therefore intended for dry indoor use.

Neodymium pot magnets with screw socket

Distinctive feature: These pot magnets have a screw socket, into which you can screw hooks, eyelets, etc. We also carry identical hook magnets as well as eyelet magnets.

Principle: The strong neodymium magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you won't be able to put as much strain on it.

Neodymium pot magnets with internal internal

Distinctive feature: These magnets have a metric internal thread and can be fastened with objects with an external thread.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you won't be able to put as much strain on it.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you won't be able to put as much strain on a pot magnet if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are not rust-proof and therefore intended for dry indoor use.

Neodymium glue-in pot magnets

Distinctive feature: These magnets are glued into indentations when screwing is not possible.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you won't be able to put as much strain on it.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Pot magnets with ferrite magnets

Distinctive feature: These magnets are ferrite and not neodymium magnets. They have therefore a lower adhesive force and are larger. But are cheaper than neodymium magnets and can be used outside as well.

Principle: The magnets are embedded in a steel pot. The steel pot increases the adhesive force of the magnet on direct contact with a thick iron surface. If there is no direct contact with the counterpart, or if the steel plate is thin, painted or rough, you won't be able to put as much strain on it.

Shear force: The indicated adhesive force was measured perpendicular to the surface to which the magnet should stick. It takes a lot less strength to move the magnet sideways. Therefore, you won't be able to put as much strain on a pot magnet if you use it on a wall as opposed to using it on the ceiling.

Rust: These magnets are rust-proof and can therefore be used outside and in wet surroundings as well. The pots surrounding the magnets, however, may develop surface rust over time.
